

Supplemental Figure 1. Growth curves of daptomycin susceptible (left) and nonsusceptible VRE (right) in LB containing the specified concentrations of ceftaroline compared to antibiotic-free control.

Supplemental Figure 2. Direct comparison of Bo-DAP (8 mg/L) binding to daptomycin susceptible and nonsusceptible VRE. Top panels show representative microscopy. Below is quantitative comparison of binding intensity (left) and number of binding foci/cell. Statistical significance measured by t-test.
